

# *10 Easy Ways to Save Energy in Your Home*

## *Find a better way to heat and cool your house.*

As much as half of the energy used in homes goes toward heating and cooling.

**The following are a few ways that energy bills can be reduced through adjustments to the heating and cooling systems:**

- Install a ceiling fan. Ceiling fans can be used in place of air conditioners, which require a large amount of energy.
- Periodically replace air filters in air conditioners and heaters.
- Set thermostats to an appropriate temperature. Specifically, they should be turned down at night and when no one is home. In most homes, about 2% of the heating bill will be saved for each degree that the thermostat is lowered for at least eight hours each day. Turning down the thermostat from 75° F to 70° F, for example, saves about 10% on heating costs.
- Install a programmable thermostat. A programmable thermostat saves money by allowing heating and cooling appliances to be automatically turned down during times that no one is home and at night. Programmable thermostats contain no mercury and, in some climate zones, can save up to \$150 per year in energy costs.
- Install a wood stove or a pellet stove. These are more efficient sources of heat than furnaces.
- At night, curtains drawn over windows will better insulate the room.

## ***Install a tankless water heater.***

Demand-type water heaters (tankless or instantaneous) provide hot water only as it is needed. They don't produce the standby energy loss associated with traditional storage-tank water heaters. Demand water heaters heat the water directly. When a hot water tap is turned on, cold water travels through a pipe into the unit. A gas burner or an electric element heats the water. As a result, demand water heaters deliver a constant supply of hot water. You don't need to wait for a storage tank to fill up with enough hot water. That translates into energy savings.

## *Replace incandescent lights.*

The average household dedicates 11% of its energy budget to lighting. Traditional incandescent lights convert approximately only 10% of the energy they consume into light, while the rest becomes heat. The use of new lighting technologies, such as light-emitting diodes (LEDs) and compact fluorescent lamps (CFLs), can reduce the energy required by lighting from 50% to 75%. Advances in lighting controls offer further energy savings by reducing the amount of time lights are on but not being used.

### **Here are some facts about CFLs and LEDs:**

- CFLs use 75% less energy and last about 10 times longer than traditional incandescent bulbs.
- LEDs last even longer than CFLs and consume less energy.
- LEDs have no moving parts and, unlike CFLs, they contain no mercury.

## *Seal and insulate your home.*

Sealing and insulating your home is one of the most cost-effective ways to make a home more comfortable and energy efficient – and you can do it yourself. A tightly sealed home can improve comfort and indoor air quality while reducing utility bills. An InterNACHI energy auditor can be hired to assess envelope leakage and recommend fixes that will dramatically increase comfort and energy savings.

**The following are some common places where leakage may occur:**

- electrical outlets;
- mail slots;
- around pipes and wires;
- wall- or window-mounted air conditioners;
- attic hatches;
- fireplace dampers;
- weatherstripping around doors;
- baseboards;
- window frames; and
- switch plates.

## ***Install efficient showerheads and toilets.***

The following systems can be installed to conserve water usage in homes:

- low-flow showerheads. They are available in different flow rates, and some have a pause button which shuts off the water while the bather lathers up;
- low-flow toilets. Toilets consume 30% to 40% of the total water used in homes, making them the biggest water users. Replacing an older 3.5-gallon toilet with a modern, low-flow 1.6-gallon toilet can reduce usage an average of 2 gallons per flush (GPF), saving 12,000 gallons of water per year. Low-flow toilets usually have “1.6 GPF” marked on the bowl behind the seat or inside the tank;
- vacuum-assist toilets. These toilets have a vacuum chamber which uses a siphon action to suck air from the trap beneath the bowl, allowing it to quickly fill with water to clear waste. Vacuum toilets are relatively quiet; and
- dual-flush toilets. Dual-flush toilets have been used in Europe and Australia for years, and are now gaining in popularity in the U.S. Dual-flush toilets let you choose between a 1-gallon (or less) flush for liquid waste, and a 1.6-gallon flush for solid waste. Dual-flush 1.6-GPF toilets reduce water consumption by an additional 30%.

## *Use appliances and electronics responsibly.*

Appliances and electronics account for about 20% of household energy bills in a typical U.S. home.

**Here are some tips that will reduce the energy they require:**

- Refrigerators and freezers should not be located near the stove, dishwasher or heat vents, or exposed to direct sunlight. Exposure to warm areas will force them to use more energy to remain cool.
- Computers should be shut off when not in use. If unattended computers must be left on, their monitors should be shut off. According to some studies, computers account for approximately 3% of all energy consumption in the United States.
- Use efficient ENERGY STAR-rated appliances and electronics. These devices, approved by the the U.S. Department of Energy and the EPA's ENERGY STAR Program, include TVs, home theater systems, DVD players, CD players, washers, dryers and more. According to the EPA, if just 10% of homes used energy-efficient appliances, it would reduce carbon emissions by the equivalent of 1.7 million acres of trees.
- Laptop and cell phone chargers consume energy when they're plugged in. When they're not connected to electronics, chargers should be unplugged.
- Laptop computers consume considerably less electricity than desktop computers.

## *Install daylighting as an alternative to electric lighting.*

Daylighting is the practice of using natural light to illuminate the home's interior.

**Daylighting can be achieved using the following approaches:**

- skylights. It's important that they be double-pane or they may not be cost-effective. Flashing skylights correctly is key to avoiding leaks;
- light shelves. Light shelves are passive devices designed to bounce light deep into a building. They may be interior or exterior. Light shelves can introduce light into a space up to 2½ times the distance from the floor to the top of the window, and advanced light shelves may introduce four times that amount;
- clerestory windows. Clerestory windows are short, wide windows set high on the wall. Protected from the summer sun by the roof overhang, they allow winter sun to shine through for natural lighting and warmth; and
- light tubes. Light tubes use a special lens designed to amplify low-level light and reduce light intensity from the midday sun. Sunlight is channeled through a tube coated with a highly reflective material, then enters the living space through a diffuser designed to distribute light evenly.

## ***Insulate windows and doors.***

About one-third of the home's total heat loss usually occurs through windows and doors.

**The following are ways to reduce energy lost through windows and doors:**

- Seal all window edges and cracks with rope caulk. This is the cheapest and simplest option.
- Windows can be weatherstripped with a special lining that is inserted between the window and the frame. Install weatherstripping around the whole perimeter of doors to ensure a tight seal when they're closed. Install quality door sweeps on the bottom of the doors, if they aren't already in place.
- Install storm windows. A removable glass frame can be installed over an existing window.
- If existing windows have rotted or damaged wood, cracked glass, missing putty, poorly fitting sashes, or locks that don't work, they should be repaired or replaced.

## *Cook smart.*

An enormous amount of energy is wasted while cooking.

**The following recommendations and statistics illustrate less wasteful ways of cooking:**

- Convection ovens are more efficient than conventional ovens. They use fans to force hot air to circulate more evenly, thereby allowing food to be cooked at a lower temperature. Convection ovens use approximately 20% less electricity than conventional ovens.
- Microwave ovens consume approximately 80% less energy than conventional ovens.
- Pans should be placed on the matching-size heating element or flame.
- Put a lid on it. Lids make food heat more quickly than pots and pans that do not have lids.
- Pressure cookers reduce cooking time dramatically.
- When using conventional ovens, food should be placed on the top rack. The top rack is hotter and will cook food faster.

## *Change the way you do your laundry.*

- Avoid using the half-load or medium-size setting on your washer. Wait until you have a full load of laundry to get the most water and energy savings out of your appliance.
- Avoid using high-temperature settings for lightly soiled laundry. Water that is 140° F uses far more energy than 103° F for the warm-water setting, but the hotter water isn't more effective for getting your laundry just as clean.
- Clean the lint trap before you use the dryer, every time. Not only is excess lint a fire hazard, but it will prolong the amount of time required for your clothes to dry.
- If possible, air-dry your clothes on lines and racks.
- Spin-dry or wring clothes out before putting them into the dryer.

Homeowners who take the initiative to make these changes usually discover that the energy savings are more than worth the effort. However, you should consider that inspectors can make this process much easier and perform a more comprehensive assessment of energy-savings potential than you can. Contact us today to schedule an Energy Audit for your home.
